ISO 27001 Certification

1. Purpose/Summary

This document records Veridian Dynamics' ISO/IEC 27001:2022 certification, issued by Meridian Standards Registrar following a successful Stage 1 and Stage 2 audit of the company's Information Security Management System (ISMS). The certification confirms that the ISMS, covering the scope of the production payment processing environment and supporting corporate IT functions, conforms to the ISO 27001 standard's requirements for establishing, implementing, maintaining, and continually improving information security.

2. Background/Context

Veridian Dynamics began its ISO 27001 certification journey in 2025 as part of a broader strategy to support expansion into international markets where ISO 27001 certification is a common procurement requirement for payment service providers. The IT department, in partnership with an external ISMS consultant, conducted a gap assessment against the standard's Annex A controls in early 2025, implemented remediation across 18 identified gaps throughout the year, and underwent Stage 1 documentation review in November 2025 followed by Stage 2 on-site audit in February 2026. The certification scope explicitly includes the AWS-hosted production environment, the corporate office network in Gotham City, and the software development lifecycle, but excludes certain back-office HR systems managed entirely within PeopleHub, which are addressed under a separate internal control framework.

3. Main Content

3.1 Statement of Applicability

Of the 93 Annex A controls in ISO/IEC 27001:2022, 87 were determined applicable to Veridian Dynamics' ISMS scope; 6 were excluded with documented justification, primarily related to physical media handling controls not applicable to the company's cloud-native infrastructure.

3.2 Audit Findings

The Stage 2 audit identified 2 minor nonconformities related to incomplete documentation of supplier security review records and inconsistent application of the asset inventory tagging standard. No major nonconformities were identified. Both minor nonconformities were remediated within the 90-day corrective action window required by the certification body.

3.3 Certification Validity and Surveillance

The certificate is valid for three years from the date of issuance, subject to annual surveillance audits conducted by Meridian Standards Registrar. The first surveillance audit is scheduled for March 2027.

3.4 Relationship to Internal Policy

The ISMS is operationalized through the Information Security Policy (ISP-001) and related procedures, which were updated during the certification project to explicitly map to Annex A control references.

4. Key Details

Element	Detail
Standard	ISO/IEC 27001:2022
Certification body	Meridian Standards Registrar
Certificate issuance date	March 5, 2026
Certificate validity	3 years, annual surveillance
Applicable Annex A controls	87 of 93
Excluded controls	6 (physical media handling)
Minor nonconformities	2 (remediated within 90 days)
Major nonconformities	0

5. Exceptions, Risks, or Open Issues

Both minor nonconformities identified during the Stage 2 audit have been closed and verified by the certification body through submitted evidence, without requiring a follow-up site visit. IT has flagged that maintaining the asset inventory tagging standard will require ongoing discipline as new AWS resources are provisioned for the planned Digital Asset product line, and has proposed automating tag enforcement through infrastructure-as-code policies ahead of the 2027 surveillance audit. The current ISMS scope does not include the three newly launched international markets' local data processing arrangements, which may need to be addressed in a future scope expansion.
